

MOUNDING A PLANT

When a plant grows, it sometimes gets a big stem before having roots big enough to hold the weight of the plant.

In order to help it grow, and prevent it from falling or not growing straight, you can « mound » your plant.

It consists in putting a little amount of soil around the stem to reinforce it until the roots are deep enough to hold the plant by themselves.

It can also protect the plant in case of heavy rain or wind.
