

# PARTS OF A PLANT

A plant has many different parts. Each part has a different purpose and each part helps the plant to survive 😊

😊 Plants are essential for any ecosystem. They provide all the energy for the ecosystem, because they **can get energy directly from sunlight**. They use a process called **photosynthesis** to use energy from the sun to grow and reproduce. **They also get nutrients from the soil**. Those nutrients get into the soil when decomposers break down waste and dead materials.
