

## VERTICAL STRUCTURES

**Growing plants in a vertical way can often be a good idea.** You can do it because **the plant likes to grow in a vertical way**, like beans or roses. Or, you can do it **just to gain some space** : sometimes the garden is too small and it can be good to make the plants climb to save some space and still have a lot of plants in your garden !

They are all kinds of structures that you can do : here are a few examples, but keep in mind that you just have to **choose the structure according to the size and weight of the plant you are growing** (something strong for cucumber, but not so strong for beans for example).
